(ABSTRACT)

A submerged-media biological aerated filter (BAF) has been studied to 1) evaluate oxygen transfer kinetics under conditions without biological growth and 2) determine the influence of biological growth on the rate of oxygen transfer. Collectively, the study evaluates the rates of supply and consumption of oxygen in BAFs. The mass-transfer characteristics of a submerged-media BAF were initially determined over a wide range of gas and liquid flow rates without the presence of bacteria. The mass-transfer coefficients ($K_{L_{a(T)}}$) were measured using a nitrogen gas stripping method and were found to increase as both gas and liquid superficial velocities increase, with values ranging from approximately 40 to 380 h$^{-1}$. The effect of parameters including the gas and liquid velocities, dirty water to clean water ratio, and temperature dependence was successfully correlated within $\pm$ 20% of the experimental $K_{L_{a}}$ value. The effects of the media size and gas holdup fractions were also investigated. Stagnant gas holdup did not significantly influence the rate of oxygen transfer. Dynamic gas holdup and the difference between total and stagnant gas holdup were found to increase with an increase in gas velocity. Neither liquid velocity nor liquid temperature was determined to have a significant impact on gas holdup.

A tertiary nitrification BAF pilot unit was then operated for 5 months downstream of a secondary treatment unit at a domestic wastewater treatment facility. The study investigated the oxygen transfer capabilities of the nitrifying unit with high oxygen demand requirements through a series of aeration process tests and explored the presence of oxygen transfer enhancements by further analyzing the actual transfer mechanism limitations. It was determined that (assuming OTE = 20%) aerating the BAF pilot unit based on the stoichiometric aeration demand resulted in overaeration of the unit, especially at lower pollutant loading rates. Endogenous respiration contributed to only 2 – 7% of the total oxygen demand with regions of biomass activity changing with varying loading conditions.
An enhanced oxygen transfer factor was determined in the biologically active pilot. Although it cannot be definitively concluded that the observed oxygen transfer factor is either due to biological activity or not simply an artifact of measurement/analysis techniques, the enhancement factor can be mathematically accounted for by either an increase in the $K_La$ factor or the associated driving force using a proposed enhanced bubble theory.
ACKNOWLEDGEMENTS

I would like to express my appreciation to the Degremont North American Research and Development Center, Inc. (DENARD), Virginia’s Center for Innovative Technology, and the Edna Bailey Sussman Fellowship for their financial support throughout the duration of the project. I would also like to acknowledge the personnel at the Blacksburg-VPI Sanitation Authority Lower Stroubles Creek Wastewater Treatment Plant in Blacksburg, VA as well as the Roanoke Water Pollution Control Plant in Roanoke, Virginia for their assistance in supplying secondary effluent for the study as well as the Proctors Creek Wastewater Treatment Plant in Chesterfield, VA, for use of their facility. In particular, I would like to thank the operators and maintenance staff at the Roanoke WPCP whose help went above and beyond the call of duty.

I would like to express special thanks to my co-advisors John Little and Nancy Love for providing each of their expertise and advice to allow both the project and me to mature over the last two years. In addition, special thanks should also go to Troy Holst with Ondeo Degremont for his guidance and support. I would like to acknowledge my third committee member, Mark Widdowson, for his input as well.

I would like to acknowledge the assistance of Julie Petruska and Jody Smiley of Virginia Tech, undergraduates Brandon Flint and Gregory Brazeau, and the piloting and laboratory crew at DENARD who all provided aid for the successful completion of the experimental work as well as members of the Love lab who made life in Durham bearable.

Finally, I would like to express my utmost appreciation to my parents and family who have supported me in all my decisions.
