I am greatly indebted to Dr. Kent A. Murphy for the support he has extended to me throughout my work towards this thesis, and for his informed guidance and advice. Whether my conundrum concerned something as minor as what classes to take, or something as significant as the wisdom of accepting a job offer, Dr. Murphy always offered me good advice and brought previously unrecognized aspects of each situation to my attention. It was through him that I learned of the job opening at Bell Labs.

I also extend my sincere gratitude to Dr. Richard O. Claus who, when I had only the vaguest idea of what an optical fiber was but was curious to learn more, gave me the opportunity to work at FEORC, offered me encouragement, and took the time to explain the various nuances of the different projects at FEORC. After my experience at FEORC encouraged me to consider graduate school, both Dr. Claus and Dr. Murphy made it a possibility.

Dr. Russell May has had a significantly positive influence on my development through his role as both my project leader and my advisor. It was under his direct supervision that the work contained in this thesis was performed. His patience and willingness to discuss the minitiae of the different obstacles I encountered while working on this project were invaluable.

Dr. Tianchu Li became a mentor of mine while we worked together to develop the sapphire-based WSFMI sensor. His extensive knowledge of optical phenomena and his enthusiasm as an educator introduced me to the breadth and variety of the field of
optics. I greatly appreciate the many impromptu optics lectures he conducted on any available writing surface, whether it be scratch paper or a white-board.

I am also grateful for the encouragement that Dr. Ashish Vengsarkar gave me to finish this thesis. In addition to helping me motivate to sit down and write, he loaned me his brand-new PC laptop to use to write the first draft of this thesis, and he helped me arrange to return to Virginia Tech for my defense.

Dr. Susan Houde-Walter has also made the completion of this final version of my thesis a possibility. Without her ensuring that I had the time and the motivation to complete the corrections to this thesis, the completion might have been delayed indefinitely.

My thanks also go to Manish Nasta and Cynthia Grinder, who patiently tutored me in the fine art of handling optical fiber and assembling EFPIs. While I was an undergraduate, Marten DeVries ensured that I always had interesting projects to which to apply myself, and he never tired of answering my questions.

This thesis is dedicated to my parents, Joseph and Elizabeth Pedrazzani, who have always supported me in my endeavors, always given me the strength and encouragement to follow my dreams, and have never left me in doubt of their love for me.
