This project is the result of a close collaboration between myself and Virginia Tech, WAAC, Professors - Paul Emmons, Marco Frascari, Marcia Feuerstein and Jaan Holt. Also, my research and thesis has been challenged and enriched by these professors while taking their graduate seminars. Most valuable assistance, especially in the initial setting and the final execution of the project, came from my commitee chair, professor Paul Emmons.
My special thanks goes to:

My Parents for their unlimited support and love during all these years!

My personal Hero, my brother Alden for giving his life for mine and giving me opportunity to explore life!

My best friend, my love, my personal chef, my everything, my husband Frank for his overwhelming love and support!

If we consider humanity’s creations as much part of the natural world as the earthly creations (such as a tree might be), then the building can also be defined as the natural and/or the artificial object. However, if we consider artificial as something that by definition is man-made, then the argument that follows would not hold.
Contents
Natural Geography deals with physical characteristics of buildings (in an architectural sense), their bodily placement in regards to the greater physical area, the distribution of its features (walls, partitions, ornaments, doors, windows, etc.) and their effects on the human activity in the building. Natural Geography of the building depends on its anchored position, its surface features, and most importantly, of the physical area on which the building is placed.
Border, or limit; the line or a plane indicating the extent or limit of something

DUBROVNIK. BOUND BY WALLS.
The line of the intersection of two surfaces; the point where something begins
Something that indicates the presence of something else; breaking the uniform appearance of a solid surface.
- The physical substance; a mass of matter; the main portion of an army, plant, building etc.; existing as a complete and separate entity.
