ACKNOWLEDGEMENTS

The author would like to express the utmost appreciation to his adviser, Dr. Roe-Hoan Yoon, for his guidance, confidence and support during the course of this investigation. Deepest appreciation also goes to Dr. Gerald H. Luttrell for his invaluable experience in process engineering. The author also thanks Dr. Gregory T. Adel for knowledge and advice during the course of the investigation, in particular during the development of the prediction model of the electrostatic separator.

The author is grateful for the financial support from the United States Department of Energy under grant DE-AC22-95PC95151 and technical support from Dr. Dennis Finseth.

Gratitude is due to Eric Yan for his technical guidance during the experimental work and support during various stages of the investigation. Thanks are extended to Wayne Slusser, Roy Hill, Guofu Li, Dr. Anatoly Meshnayashin and Billy Slusser for their assistance while conducting the experiments. Special thanks are due to Partha, Vivek, Rajesh, Mendi and Sunny for their technical suggestions and assistance during the course of the study in the Department of Mining and Minerals Engineering. The author would also like to thank them along with Govi and other friends in Blacksburg, for their moral support during the author's stay in Blacksburg.

Last but not the least, the most cordial appreciation is expressed to the author's beloved parents for their continued encouragement and brother Praveen, for his constant support and understanding.
