(Abstract)

This dissertation presents a case study the Learning in Networked Communities (LiNC) project. The focus of the study is on the social processes involved in the development and deployment of technologies associated with the LiNC project. These processes involved the work of university investigators, software developers, teachers and other researchers. The technologies that were developed and deployed were collaborative computer network-based software tools for use in several local high school and middle school science classrooms.

I discuss methodological implications for the study of the social construction of technology in the field of Science and Technology Studies in regards to my methodological approach to the study of this project. I describe the political context of surrounding the National Science Foundation and the funding of research and development programs related to the Internet. I trace the historical infrastructure development of Internet technologies especially as they relate to the technology developed in the LiNC project. I describe the execution of the main grant that funded the LiNC project, the methods employed in that study, and the activities of researchers, teachers, and students focusing on their perspectives, interactions, and understandings of the events of that period of time. Finally, I draw conclusions about such study of technological development, university research, teaching, the field of Human-Computer Interaction, and the prospects for future research in these areas.

This work was supported by the National Science Foundation, the Hitachi Foundation, and the Office of Naval Research, Apple Computer, IBM, and Sun Microsystems.
