Technology in Society:
The Pipe Organ in Early Modern England

Caroline Woodell Cagle

(ABSTRACT)

The rise of English Protestantism produced a curious phenomenon in early modern England: the silencing of pipe organs in cathedrals and parish churches across the land. During the sixteenth and seventeenth centuries, this ecclesiastical instrument figuratively embodied and literally gave voice to the Roman Catholic Church. Because this ancient technology was perceived to be emblematic of much that was despised in Catholic ritual, it came under assault by the Anglicans, the Puritans, the Monarchy, the Parliament, Oliver Cromwell’s army, and even the militant rabble-rouser in the street. My dissertation shows that it was the symbolic role played by the organ that bore the responsibility for this violence. My hypothesis is further enhanced by an investigation of the events immediately following the Commonwealth Era, when the Restoration of the Monarchy resulted in the restoration of the pipe organ.

In this detailed case study, I examine the role of the organ as a stable technology in the unstable society of early modern England. During the time that the ecclesiastical organ personified the Roman Catholic Church, it was persecuted. As soon as the balance of power shifted, this symbolism was no longer significant and the King of Instruments was restored to its long-accustomed place in the service of worship in English society. My analysis of the multifaceted relationship that existed between this well-established, essentially transparent technology and the diverse social structures that attempted to annihilate it shows the significance of using the concept of technology as symbol as an appropriate analytical category for interpreting the history of the organ in early modern England.
Acknowledgments

I am indebted to Dr. Joseph Pitt, my dissertation committee chair, for suggesting this topic to me and for guiding me with wisdom and patience through the decade that it has taken me to arrive at this point in my life. I thank him for his insight and most of all for understanding that I love the pipe organ more than the computer. I wish him well with his piano lessons. I also offer my sincere appreciation to the other long-suffering members of my committee – Dr. Richard Burian, Dr. Ann La Berge, Dr. J.A.N. Lee and Dr. Barbara Reeves – for their interest, encouragement, patience and attention to detail.

I would be remiss if I failed to give special thanks to my daughter Cary Morrison, who looked after me in Blacksburg and served as my traveling companion and research assistant in London. Her continuing support has been invaluable. I also offer belated thanks to my parents, Russell and Martha Woodell, both deceased, who gave me the foundation for a life well lived. I am much indebted to my dear friend Dr. H. D. Luck, whose encouragement has been essential to the completion of this work.

Ouachita Baptist University in Arkadelphia, Arkansas provided me with study leave for course work at Virginia Tech, additional travel funds to help with my research in London, and a sabbatical year that allowed me to complete this project. Marla Rigsby in the Computer Services Department at Ouachita offered valuable technical assistance. A very special thanks goes to my friend and colleague, as well as my choir director and organ teacher, Russell Hodges. To all of my encouraging colleagues whom I have neglected to mention and to my special friends who have supported me along the way, I offer my heartfelt thanks.
