Final Design - The temple of Candomble

Site Plan
Final Design- The temple of Candomble

The foundation plan is drawn to show the placing of the different footings as well as the foundation walls that are used to respond to the different sloping site. Around the perimeter of the temple is a concrete base that supports the hollow clay bricks for the infill walls. The ground floor steps towards the back of the temple to come to a comfortable height that connects the temple to the residence for the priest.
Final Design- The temple of Candomble

The entrance to the temple is directly connected to the new stairs, yet remains discrete to honor the element of secrecy that accompanies Candomble. Presently, some neighborhoods in the country choose to keep Candomble a secret because it is not accepted by mainstream Brazilian society. The first space of the temple is the same space that was dedicated to the Orixas in the old temple. The Orixas are organized as display figures placed in small stone openings in the wall. As previously mentioned, some of these cubbies are covered because some Orixas cannot be exposed to the outdoors and others cannot be in the presence of other Orixas. There are a total of sixteen cubbies, which can be seen from outside and inside the temple.

The main door to the temple is a sliding door, which remains closed during ceremonies. The door has a folding bench that comes down to provide continuity around the perimeter of the room. Also, when the bench is down, it acts as the locking mechanism for the temple after closing. The track for the door runs across the ceiling from the inside of the temple.

The ground floor of the ceremonial space is made of mud tiles that were made from the dirt that came out of the footings for the building. This directly connects the temple with the underground world where the Orixas are believed to be located.
Final Design- The temple of Candomble

The center of the site is also the center of the ceremonial space, with a circular pattern on the mud tiles marking this most sacred area of the temple. At the center, the temple opens up to the sky with only the removable canvas roof covering the opening when it rains. The square area of the sacred space is symmetrical to the floors above, breaking up each floor into three different spaces in the front and the back of the temple. Towards the back of the first floor, tucked under the stairs, is the consultation space where the priest can have customers come in for spiritual healing. The furniture on the ground floor consists of the benches that are around the perimeter of the ceremonial space, including the folding bench attached to the main door, the shorter bench used by the drummers, and the consultation table and chairs under the stairs.

The first floor is ventilated with natural air coming from the façade of the temple. This façade uses the same infill clay bricks as the rest of the temple, but here the bricks are turned to let the air pass through the hollow part of the brick. The air circulates through the temple, moving towards the back, then vertically, and finally coming out from the circular opening at the center and the opening at the back of the building where the stairs are located. Natural light also comes from both of these openings, allowing the building to stay free of humidity that commonly attracts mold.
Final Design - The temple of Candomble

1st Floor Plan
The second floor is the religious library and reading room. Candomble is becoming a forgotten religion by the younger generations who are not following the beliefs. The library allows new members of the religion who will be spending a few weeks in isolation, to have all their study materials readily available. The room is naturally ventilated and lit in the same manner as the first floor. A round table located at the center doubles as the reading table and railing for the opening on the floor. The table has sixteen legs, mimicking the Orixas’ cubbies at the entrance of the temple. The design attempts to enhance the spiritual atmosphere by allowing the student to study in a natural setting. Most importantly, the table is located within the sacred circle, symbolizing the gathering of knowledge not only from the reading material, but also a sacred knowledge coming from the spiritual circle of the Orixas. Books that are placed on the table can be seen from the ceremonial space below, creating a connection between these two sacred spaces. Similar to the continuity created by the benches on the first floor, the bookshelves line the perimeter of the second floor. The bookshelves on the right side of the space narrow down at the ends to highlight the circulation route to the stairs leading to the courtyard floor above. At the end of this library is another sliding door, half the size of the main sliding door.
Final Design- The temple of Candomble

This passageway leads to a landing/balcony space that does not overhang, and slows your ascend to the courtyard floor above. This design of the landing and the stairs to the next floor is symmetrical to the design of the landing and stairs on the first floor. The two spaces that are created in the front and the back of the temple are the vertical circulation spaces, while the circulation to the top of the temple is in a circular and vertical pattern. This pattern relates to the counterclockwise movement created during the ceremonies of Candomble.
Final Design- The temple of Candomble

2nd Floor Plan
Final Design - The temple of Candomble

While climbing the steps to the third floor above, one is now outdoors but covered by the roof above. At the top of the stairs there is another landing that frames a view of the neighborhood before you turn to enter the third floor, which acts as a courtyard. The first view on this level is the opening at the center, which has a railing made of glass blocks where one can look down into the floors below. Towards the back of the third floor is another opening that allows natural light to go down into the stairs and allows the air to exist. Towards the front of the temple, continuing with the counterclockwise circulation, is another balcony that acts as a pulpit. This balcony is cantilevering, symbolizing a way for the temple and the religion to extend out to the community. On this pulpit, the priest can talk to the community and creates a view of the neighborhood on one side and the Bay of Saints on the other.

The wood framed roof is similar to that of the original temple, but has clay tiles instead of corrugated fiberglass. This roof has a three foot overhang that represents the Portuguese Architecture, but slopes towards the inside of the third floor. This symmetrical system occurs at the back of the church, making the middle part of the roof overlap with the two outer roofs. This design allows water to drain from the roof in a controlled manner.
Final Design- The temple of Candomble

The center roof is a removable, transparent canvas that protects the temple from water going into the opening in the middle and allows light to shine through. For added sunlight, the canvas can be removed. The clay tiles are made of the same material as the walls and floors on the first floor. The roof tiles are flipped to create a channel that carries water to rain chains attached at the end. The water then travels down to the clay tile channels created on the sloped floor slab and drains out. Finally, the roof contains solar panels that are embedded in the roof tiles, allowing the temple to generate energy. Solar panels power the temple at night without having to use electricity from the grid.

The courtyard is placed on the roof to account for space constraints. The third floor simulates the temples of the Yuruba people, with a courtyard in the middle and sloping roofs framing the courtyard.

Joaquín Gustavo Robles
1800 Dewitt Ave. Alexandria, Virginia 22301 • (703) 901-0153 • roblesjoaquin@gmail.com

Education
Virginia Polytechnic Institute and State University
Master of Architecture
Degree: to be awarded
GPA 3.34/4.0
Thesis Title: “Religion and Architecture – Designing a Temple of Candomble in Salvador Bahia, Brazil”

The Catholic University of America
Bachelor of Architecture
Degree Conferred: May 2005
GPA 3.4/4.0
Dean’s List, 2004-2005

Northern Virginia Community College
Associates of Applied Science in Architectural Technology
Degree Conferred: May 2003
GPA 3.6/4.0
Dean’s List, 2001-2003

Professional Experience
Architectural Intern
November 2005 – June 2007
Hayes Architects
McLean, VA
Specific responsibilities include:
Under supervision of registered architect, contributed to design of commercial and residential projects from the conceptual stage to the construction documents
Prepared 3D modeling and Photoshop rendering for conceptual and client meetings
Worked closely with interior designer to lay out and plan interior room arrangements for commercial buildings, using computer-assisted drafting (CAD) equipment and software
Attended construction phase meetings

**Architectural Intern**
Gauthier Alvarado and Associates  
May 2005 -November 2005  
Falls Church, VA

Specific responsibilities include:
Under supervision of registered architect, contributed to design of commercial and residential projects from the conceptual stage to the construction documents
Prepared material and color palates
Completed post-construction survey of projects

**Architectural Intern**
O’Norte Architects  
May 2004-August 2004  
Recife, Brazil

Specific responsibilities include:
Assumed lead in designing and launching company website
Contributed to design of a restaurant and hostel in Olinda, Brazil

**Related Experience**

**Teacher’s Assistant - Brazil Summer Studio**  
July 2006-August 2006
Axis Mundi - non-profit organization
The Brazil Studio is an architectural design-construction program, based in Brazil, where students and professionals create community based projects involving architecture, landscape and urban design.

**United States Marine Corps**  
August 1998-August 2006
Rank: Sergeant
Infantryman/Nuclear, Chemical, Biological Rapid Extraction Team
Secret Clearance. Honorable Discharge effective 08/05/06
Certified Emergency Medical Technician
Military Law Enforcement Course at Marine Corps Base Camp Lejeune, NC
Team Leader Rapid Extraction Team/ Casualty Extract Team, CBIRF 2000-2001
Additional Qualifications

Computer Skills
Proficient in the use of both Windows and Macintosh operating systems with programs including Word, Excel, PowerPoint, Internet Research, Photoshop CS, AutoCAD, Vectorworks, 3D Max, Sketch up, Dreamweaver, Macromedia Flash

Artistic Skills
Proficient in model building, hand drafting and color rendering

Language
Bilingual in English and Spanish, conversational knowledge of Portuguese, Native Spanish Speaker; fluent in reading, writing, and speaking Spanish

Professional Associations

Participant
ENEA (National Conference for Architectural Students), Brasilia, Brazil
Attended architectural classes, discussions and hands on activities

Secretary
American Institute of Architecture Students (AIAS)
Organized student field trips
Recruited new members
