Table of Tables

Table 2. 1 The anatomical structure measurement result for southern yellow pine ..................37
Table 2. 2 The anatomical structure measurement result for Scots pine..............................37
Table 2. 3 The anatomical structure measurement result for soft maple...............................37
Table 2. 4 Southern yellow pine model predicted tangential thermal conductivity values in the range of latewood percentage from 10% to 99% and MC from 0% to 30%..............................61
Table 2. 5 Southern yellow pine model predicted radial thermal conductivity values in the range of latewood percentage from 10% to 99% and MC from 0% to 30%..............................62
Table 2. 6 Scots pine model predicted tangential thermal conductivity values in the range of latewood percentage from 10% to 99% and MC from 0% to 30%..............................66
Table 2. 7 Scots pine model predicted radial thermal conductivity values in the range of latewood percentage from 10% to 99% and MC from 0% to 30%..............................67
Table 2. 8 Scots pine model predicted tangential thermal conductivity values in the range of latewood percentage from 5% to 99% and MC from 0% to maximum 178%.................................72
Table 2. 9 Scots pine model predicted radial thermal conductivity values in the range of latewood percentage from 5% to 99% and MC from 0% to maximum 178%.................................72
Table 2. 10 Maple model predicted radial and tangential thermal conductivity values, and the ratios (R/T) in the MC change from 0% to maximum 30%.........................................................78
Table 2. 11 Number of testing specimens for each test specified.............................................83
Table 2. 12 The temperature set-ups on the R-MATIC instrument for each of the test.............86
Table 2. 13 Southern yellow pine thermal conductivity values from the experiments under the specified conditions (treatments) with one replication for each category........................................89
Table 2. 14 Scots pine thermal conductivity values from the experiments under the specified conditions (treatments) with one replication for each category........................................89
Table 2. 15 Maple thermal conductivity values from the experiments under the specified conditions (treatments) with one replication for each category........................................89
Table 2. 16 Correlation between SYP radial thermal conductivity values and latewood percentage (LW%) measured from SYP radial boards.................................................................90
Table 2. 17 Correlation between SYP tangential thermal conductivity values and latewood percentage (LW%) measured from SYP tangential boards....................................................91
Table 2. 18 Correlation between Scots pine radial thermal conductivity values and latewood percentage (LW%) measured from Scots pine radial boards........................................91
Table 2. 19 Correlation between SYP specific gravity and latewood percentage measured from testing boards .................................................................................................................................................92

Table 2. 20 Correlation between Scots pine specific gravity and latewood percentage measured from testing boards .................................................................................................................................................92

Table 2. 21 Regression for the thermal conductivities as functions of temperature of the three species in the two directions .................................................................................................................................................93

Table 2. 22 Thermal conductivities in two directions for the three species and specific gravities measured from the testing boards .................................................................................................................................................96

Table 2. 23 Testing results and models' estimations comparison for the thermal conductivity of three species .................................................................................................................................................97

Table 2. 24 Amended table for thermal conductivities from testing results and modified model estimations .................................................................................................................................................98

Table 3. 1 Average results from the measurements for the angle and latewood percent on the cross section of each testing block .............................................................................................................................................159
