Acknowledgements

This dissertation could not have been finished without the help and support from many professors, research staff, graduate students, colleagues and my family. It is my great pleasure to acknowledge people who have given me guidance, help and encouragement.

I would like to first thank Dr. R. O. Claus for his constant guidance, personal attention, suggestions and endless encouragement and full support during last four years of my graduate study and research. He gave me opportunities to participate in this research program, and to work with talented research staff and graduate students in his research center.

Special thanks go to my advisory committee members professor William B. Spillman, Jr., professor Diana Farkas, professor Guo-Quan Lu, and professor Louis Guido for their endless, important suggestions and remarks in this research program and for their time and effort in service on my doctoral committee despite their already heavy loads of responsibility.

I would like to express my sincere appreciation to research scientists Dr. Liangmin Zhang, Dr. Youxiong Wang, and Dr. Tingying Zeng, who gave me enormous valuable discussions, technical support and hands-on help in many aspects of this research program, and their caring and concern about this dissertation.
My special appreciation goes also to Professors Jin Z. Zhang and Dr. Michael C. Brelle in the Chemistry and Biochemistry Department, University of California Santa Cruz, who provided generous femtosecond ultrafast laser spectroscopy measurements. They also gave me much information and discussion in this respect. Thanks also go to professor Sandra J. Rosenthal in the Chemistry Department of Vanderbilt University for her assistance with the preparation of CdSe nano-crystals.

It has been my pleasure to work with graduate students and colleagues in the Fiber & Electro-Optics Research Center, they are Roger Duncan, Cathy Hui, and Qiao Chen. We discussed together, exchange ideas, and helped each other. Those made my years at Virginia Tech the most memorable period in my life.

Finally, I would express my gratitude to my parents, my parents-in law, my wife and my son and my brothers, whose support and constant encouragement helped me through the hard times of this program. My deepest appreciation is expressed to them for their love, understanding, and inspiration. Without their blessings and encouragement, I would not have been able to finish this work.
Table of contents

Chapter 1.  Introduction 1

1.1  Electro-optic and nonlinear optical properties of materials  2
1.2  Electro-optic devices  6
1.3  Objectives of research  9
1.4  References  12

2.1  Introduction  15

2.1.1  General theories and concepts concerning semiconductor nano-crystals  15
2.1.2  Preparing of Semiconductor nano-clusters  22

2.2  Films preparing  25

2.2.1  Electrostatic self-assembly (ESA) technique  25
2.2.2  Spin coating of nano-particle doped polymeric EO films  28
2.2.3  Poling of spinning coated electro-optic films  29

2.3  Characterization of fabricated nano-clusters and e-o films  31

2.4  Experimental procedure  32

2.4.1  II-VI semiconductor nano-crystals and films preparation  32
2.4.2  Preparing of electro-optic films by ESA technique  33
2.4.3  Spin coating of nano-particle doped polymeric EO films  34
Chapter 3. Electro-optic Properties of II-VI Semiconductor Nano-clusters and Electro-optic Chromophores

3.1 Introduction

3.1.1 Electro-optic properties of semiconductor nano-cluster materials

3.1.2 Electro-optic properties of electro-optic chromophores

3.2 Measurements of Electro-optic Pockels and Kerr coefficients

3.2.1 Linear electro-optic coefficient measurement by ellipsometric setup

3.2.2 Linear Electro-optic coefficient measurement by MZI setup

3.2.3 Quadratic electro-optic coefficient measurement by ellipsometric setup

3.3 Results and discussion

3.3.1 Polymer matric nano-cluster electro-optic films

3.3.2 Polymeric electro-optic chromophore films

3.4 Conclusions

3.5 References
Chapter 4. Application of Electro-optic Materials: Design of Polymeric Optical Modulators

4.1 Introduction 135

4.2 Waveguide analysis by means of effective index approach 139

  4.2.1 Minimum (cut off) thickness of Planar waveguide 139

  4.2.2 Channel (ridge) waveguide 144

4.3 High speed operation and traveling wave electrode design 148

  4.3.1 High speed device 148

  4.3.2 Traveling wave electrode design 154

4.4 Waveguide and electrode fabrication 158

4.5 Conclusions 159

4.6 References 160

Chapter 5. Conclusions 162
List of Figures and Tables

Fig. 1-1. Structure of MZI modulators: Basic cosine response of a MZI modulator. 7

Fig. 1-2. Power-length product as function of switching speed of some electro-optic and nonlinear optical materials. 9

Fig. 2-1. Densities of states for 3D, 2D, 1D, and 0D systems. 18

Fig. 2-2. Enhanced confinement and oscillation strength in compressed excitons. 20

Table 2.1. Number of total atoms and percentage of surface atoms vary with radius of nano-clusters. 21

Fig. 2-3. Formation of surface capped semiconductor nano-crystals. 23

Fig. 2-4. ESA schematic for buildup of multilayer assemblies by consecutive absorption of anionic and cationic molecule-based polyelectrolytes. 27

Fig. 2-5. ESA processing of polymers in combination with water-soluble nano-cluster quantum dots allows wide variation of thin-film properties. 27

Fig. 2-6. Needle corona poling set up. (a) Configuration; (b) Picture of poling set up. 30

Fig. 2-7. Room temperature absorption spectra of CdS, CdSe and CdTe nano-crystallites with different particle sizes. (a): 2-3 nm diameter of CdSe, Cds, and CdTe nano-particles, (b): CdSe nano-particles at various sizes. 32

Fig. 2-8. Pictures of various films ready for measurements. 35

Fig. 2-9. Optical absorption spectrum of CdS anao-particles dispersed in pridine. 37
Fig. 2-10. Luminescence spectrum of CdS solution (CdS dispersed in pridine).
   Peak intensity is at 526.6 nm.

Fig. 2-11. Optical absorption spectra of CdSe films and solution.

Fig. 2-12. Luminescence spectra of CdSe films fabricated by spin coating and ESA.

Fig. 2-13. TEM (A) and diffraction ring (B) of CdS nano-clusters.

Fig. 2-14. TEM (A) and diffraction ring (B) of CdSe nano-clusters.

Fig. 2-15. Calculated absorption band edge varies with the diameter of CdS quantum dots.

Fig. 2-16. Calculated threshold wavelength shift varies with the diameter of CdS quantum dots.

Fig. 2-17. Maximum absorption varies with thickness (number of layers) and external voltage of PS-119/PDDA films with and without external electrical field.

Fig. 2-18. Optical density varies with thickness (number of layers) and external voltage of PS-119/PDDA films with and without external electrical field.

Fig. 2-19. Peak wavelength varies with thickness (number of layers) and external voltage of PS-119/PDDA films with and without external electrical field.

Fig. 2-20. Optical absorption spectra of PS-119/PAH films with different thickness (number of bilayers).

Fig. 2-21. Absorption varies with number of bilayers of PS-119/PAH films
at peak position.  

Fig. 2-22. Optical absorption spectra of PS-119/PDDA films with different thickness (number of bilayers).  

Fig. 2-23. Absorption varies with number of bilayers of PS-119/PDDA films at peak position.  

Fig. 2-24. AFM diagram of PS-119/PAH film, 200 bilayers.  

Fig. 2-25. AFM diagram of PS-119/PDDA film, 75 bilayers.  

Fig. 2-26. Absorption spectrum verses number of bilayers, pH value of PDDA solution is 5.8.  

Fig. 2-27. Absorption spectrum verses number of bilayers, pH value of PDDA solution is 11.5.  

Fig. 2-28. Absorption varies with number of bilayers of CdSe/PDDA films at peak position (585 nm), pH value of PDDA solution is 5.8 and 11.5.  

Fig. 2-29. XPS spectrum of CdSe-PDDA film made by ESA process, pH value of PDDA solution is 11.5, concentrations are: Cd = 6.20, Se = 2.08 (atomic %).  

Fig. 2-30. XPS spectrum of CdSe-PDDA film made by ESA process, pH value of PDDA solution is 11.5, concentrations are compound Se = 43.42, alloy Se = 56.58 (atomic %).  

Fig. 2-31. XPS spectrum of CdSe-PDDA film made by ESA process, pH value of PDDA solution is 5.8, concentration is Cd = 6.14, Se = 3.48 (atomic %).
