CONCLUSION

On the internet you can be anyone you want to be.

Everyone is equal, free of all wealth, power, beauty
and social status, you are reduced to a character on
the screen. That equality is one of the reasons that it
draws so many to its land of images. It crosses all
boundaries and you can communicate with virtually
anyone in the world who is plugged in. The idea is
beautiful, communication opened to everyone,
everywhere, anytime and the best of all its cheap
but what is the real price? The threat of a decentralized
society is the ultimate price we might have to pay. After
the explorations of this thesis, it seems the only way to
derail this trend is to promote human interaction. Since
everything can be accessed easily at home, new centers must
be built which offer more to the users. These centers must
stimulate all our senses as well as offering many levels of
services. With the combination of these two elements, the
user will find that using the computer at home is lacking
something special. Human interaction
