(ABSTRACT)

Coconut mite populations and levels of damage to 2-, 4- and 10-month old Maypan and Red Malayan Dwarf nuts in Low and High Rainfall Zones of eastern Jamaica were evaluated. Damage due to the coconut mite was assessed by quantifying scarring of the nut surface, size reduction and copra yield. It was found that coconut mite populations were the same in the two rainfall zones but differed between Maypan and Red Malayan Dwarf varieties. More Maypan nuts were infested with coconut mites than Red Malayan Dwarf nuts. More 2-month old Red Malayan Dwarf nuts were attacked than 2-month old Maypan nuts while more 10-month old Maypan nuts were colonized than 10-month old Red Malayan Dwarf nuts. In both varieties, a greater percentage of 4-month old nuts had > 1,000 coconut mites than 2- and 10-month old nuts.

Nuts in the Low Rainfall Zone had greater percentage of coconut mite damage than nuts in the High Rainfall Zone. Damage was more severe on Red Malayan Dwarf than on the Maypan nuts. The water content of Red Malayan Dwarf nuts declined with increased coconut mite damage but no relationship was found between the water content of Maypan nuts and coconut mite damage. Nut size and copra yield declined significantly with increased coconut mite damage. Total copra yield loss was only about 3% in Maypan and 6% in Red Malayan Dwarf nuts because most of the nuts had < 30% surface area damage.
I wish to thank Bill Ravlin, my graduate advisor, for his encouragement and guidance throughout this program of study. His positive attitude toward my progress was a constant source of motivation. Thanks to Rick Fell and Doug Pfeiffer for consenting to be on my advisory committee, for the keen interest they showed in the research, and their invaluable suggestions. Thanks also to Ajai Mansingh (Entomologist, former academic advisor, University of the West Indies (UWI), Jamaica) for his advice and for his role in arranging the research activities.

Funding for my studies at Virginia Tech. was provided for by the USAID through IPM-CRSP. The research activities were funded in part by the Caribbean Agricultural Research and Development Institute (CARDI) and the Jamaica Coconut Industry Board (CIB). Research facilities were provided by CARDI and to a lesser extent by CIB. Special thanks to J. Reid and M. Alam (Entomologist/former Country Representative, Entomologist, respectively, CARDI), and R. Williams, B. Been and J. Steer (General Manager, Head of Research Department, and Pathologist, respectively, CIB) for providing valuable information and advice. I wish to thank C. Earle (former graduate assistant, CARDI), for making her unpublished data available to me. Thanks to H. Reid for assisting with the experimental designs and some data analyses. Thanks to the other staff of CARDI and CIB for their support, especially to the research technicians, O. James and D. Simpson, L. McDonald and drivers, D. Ximines and B. Stephens (CARDI), for their invaluable assistance in data collection.

This thesis would not be possible without the farmers/farm managers who graciously allowed me to conduct these studies on their farms and gave me information I requested of them. I would like to acknowledge the statistical Consulting Center (VPI) for their guidance with the data analyses. Thanks to T. Mack (Department Head, VPI) for the interest he showed in my progress as a student and for his advice. Thanks to my fellow graduate students, especially R. Martin, D. Robinson (Jamaica), H. Liu and A. Hillery (VPI), as well as P. Myers, P. Chung (Jamaica) and B. Carroll (VPI) for their support and encouragement. I would also like to thank my brothers and sisters and Donna for their invaluable support during the period of my research. Thanks to my parents who taught me the importance of perseverance and hard work and the many others who supported me in prayers and with encouraging words. Finally, thanks to God, who gave me the ability to complete this Masters program. To Him be the glory.

Chapter 4 Seasonal Variation of Coconut Mite Populations and Resulting Damage to Nuts in Jamaica

Introduction....................................................................................38
Materials and methods........................................................................39
Results..........................................................................................43

1. Seasonal variations in coconut mite populations and damage to nuts within two ecological zones in eastern Jamaica.................43
2. Differences between coconut mite populations and levels of coconut mite damage on Maypan and Red Malayan Dwarf coconut varieties...........................................................................46
3. Differences in levels of coconut mite populations and damage among nuts of different ages.....................................................63
4. Effects of location of trees within a stand on coconut mite populations and nut damage......................................................66
5. Effects of nut orientation on coconut mite populations and the degree of coconut mite damage..............................................66

Discussion.....................................................................................75
